

Prunus dulcis 'Nana'

(Dwarf Almond)

“The coming of spring in Lebanon is announced by white and pink Almond tree blossoms appearing everywhere in early March through April from the coast up to an altitude of 1800 meters. The Almond is cultivated in orchards, but trees can also be found growing in the wild, in forests and woodlands, in abandoned orchards, in open shrub lands, between rocks, and on dry limestone slopes. The trees that grow in the wild produce bitter or semi-sweet almond seeds. Their bitterness comes from a compound that turns into the poison cyanide when it comes into contact with water. This economically important tree has a spreading crown and can grow up to eight meters high. Its leaves are elongated, toothed, and egg-shaped, and they grow in clusters from short stubs on the branches.” *
